Ipsci

El comando Ispci muestra un resumen de todos los dispositivos conectados a la máquina a través de los buses PCI del sistema.

Funcionamiento

Ispci utiliza la información que se almacena en los directorios /proc y /sys para construir un listado de buses PCI y dispositivos conectados a ellos, de manera que podamos conocer el HW que tenemos disponible.

Para la visualización completa de toda la información que ofrece Ispci debemos ejecutar el comando con privilegios de root.

Opciones

Algunas de las opciones interesantes para utilizar el comando Ispci son las siguientes:

- -d: muestra sólo los dispositivos del fabricante indicado (en hexadecimal)
- -k: muestra los controladores (drivers) que el kernel está utilizando para cada dispositivo identificado
- -s: muestra sólo el bus indicado [Bus:Device]
- -t: muestra los dispositivos PCI conectados de manera jerárquica
- -v: muestra información detallada de los buses y dispositivos

Ejemplos

Ejemplo 1

Muestra todos los dispositivos conectados al sistema:

    Kernel driver in use: r8169
Kernel modules: r8169
```

Ejemplo 3

Muestra información detallada de los dispositivos conectados al bus PCI "08:00"

```
# lspci -s 08:00 -v
08:00.0 Ethernet controller: Realtek Semiconductor Co., Ltd. RTL810xE PCI
